Warriors of the 27th Fighter Wing,
Our ability to deploy and employ airpower and expeditionary combat support is crucial to winning the Global War on Terror — our wing is a lethal weapon in the U.S. arsenal.
Next week’s Phase II exercise will be a dynamic test of our ability to fight at a deployed location while facing the threat of conventional and chemical attack. We also have a unique opportunity to partner with the professionals from the New Mexico National Guard and com-

plete realistic, hands-on convoy training.
As a wing, we’ve prepared for this exercise in a building block fashion, starting with a CENTAF-oriented Phase II back in July. Our efforts paid huge dividends as Team Cannon members deployed around the globe during AEF 3/4 to provide combatant commanders with unrivaled operations and combat support capability.
We introduced counter-chemical warfare operations during our November PACAF-oriented Phase II. We’re now ready to step it up a

notch as we prepare for this summer’s AEF 7/8 commitment.
I’m proud of the increase in combat readiness we have accomplished over the last several months – let’s take full advantage of next week’s training opportunities to sharpen our sword. You can bet our enemies continue to sharpen theirs.

Trans-Attack Procedures in NBC Threat Areas: (AFMAN 10-100, p 93-94)

Immediately report observed attacks or enemy force sightings to your UCC or work center.
Use buddy checks to verify proper IPE wear—assist other personnel with donning.
Assist the injured if possible, otherwise remain in position and under cover until alarm change.
For missile attack warning, seek the best available protection (building, bunker). If unavailable, find overhead cover. Remain inside vehicles/equipment (windows up, doors closed, and engine off), and don IPE.
If you’re attacked without warning, don mask, move to closest protection, and don remaining

IPE. Seek overhead cover (rain gear, poncho, tarps, or plastic.)
When attack warning sounds or notification is received, vehicle and equipment operators should drive to the best available protection (building, aircraft shelter, bunker, or hangar) while passengers don IPE.
Drive vehicles and equipment into or under shelter if possible.
Keep shelters closed. Shelter teams or senior personnel in each shelter should ensure shelter doors remain closed as much as possible to limit infiltration of contamination, and control personnel entering and exiting the shelter.
Keep shelterees away from exterior walls.
Desks and interior rooms provide additional protection inside unhardened facilities.
